SUMMARY

Computer Engineering senior seeking software engineering and software developer internships. Experienced building Python applications, data-processing pipelines, machine-learning workflows, and API integrations. Strong foundation in data structures, algorithms, Linux, Git, cloud services, and full-stack development tools.

EDUCATION

Clemson University, B.S. in Computer Engineering

Expected Dec 2026

Relevant Coursework: Data Structures and Algorithms, Network Programming, Linear Optimization, Discrete Mathematics

TECHNICAL SKILLS

- **Languages:** Python, C++, C, SQL, JavaScript, MATLAB
- **Frameworks & Libraries:** React, Node.js, TensorFlow/Keras, scikit-learn, Pandas, NumPy
- **Tools & Platforms:** Git, Linux, AWS (EC2, RDS, Lambda), REST APIs, Excel
- **Concepts:** Data structures, algorithms, object-oriented programming, data preprocessing, feature engineering, testing, model validation, optimization

PROJECTS

Trends2Alpha: Python Data and Machine-Learning Pipeline

[GitHub](#)

- Developed an end-to-end Python application that retrieves external data from Google Trends and Yahoo Finance, transforms it into aligned time-series datasets, and trains stock-direction classifiers.
- Designed reusable processing stages for API ingestion, caching, feature engineering, model training, backtesting, visualization, and CSV report generation.
- Implemented approximately 20 engineered features per stock and trained 200-tree Random Forest models across five equities using an 80/20 chronological split.
- Documented setup, dependencies, runtime workflow, outputs, known limitations, and future improvements in the project repository.

Neural Network Housing Price Predictor

[GitHub](#)

- Built a Python regression application using TensorFlow/Keras to predict home prices from numeric and categorical input features.
- Implemented CSV data loading, categorical encoding, feature scaling, neural-network training, and prediction for new user-provided observations.
- Managed project dependencies and source code in GitHub with reproducible setup instructions.

JPMorgan Chase & Co. Quantitative Research Virtual Experience

Forage

- Wrote analytical Python workflows for loan-default estimation and transformed continuous FICO values into categorical risk groups.
- Used dynamic programming to optimize score boundaries, demonstrating algorithmic problem solving on a financial dataset.

EXPERIENCE

Hillwood Country Club | Server

Summers 2024 and 2025

- Worked 30-40 hours per week in fast-paced hospitality and event-service environments while coordinating priorities across guests, servers, and event staff.
- Maintained accuracy and responsiveness during high-volume service periods.

ACTIVITIES & INTERESTS

Activities: Clemson Pickleball Club; WSBF Student Radio contributor | **Interests:** Web development, logic puzzles, strategy games, reading, and music
